PRACTICAL WEEK-1

Ch. Madhulika-2520090056

Sec - 11

1. Creating an AWS Account

Step-wise procedure

1.Visit the official AWS website at https://signin.aws.amazon.com to begin the account creation process.

2. Select the **Create an AWS Account** option to start registration.

3. Provide a valid email address and enter a suitable account name in the required fields.

Email Address: chilumulamadhulika@klh.edu.in

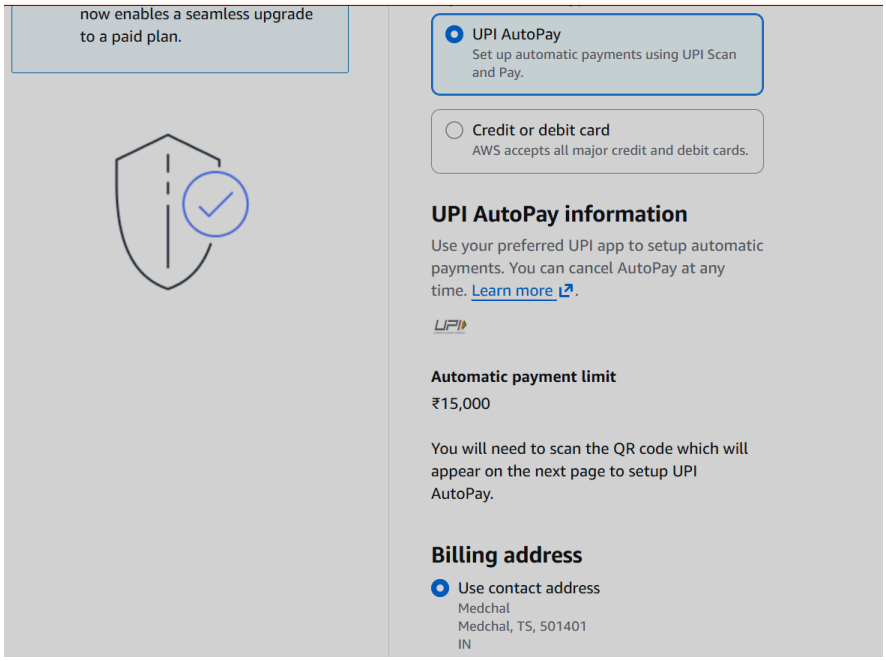

Account Name: Madhulika

4. Complete the email verification process by entering the OTP received on the registered email address.

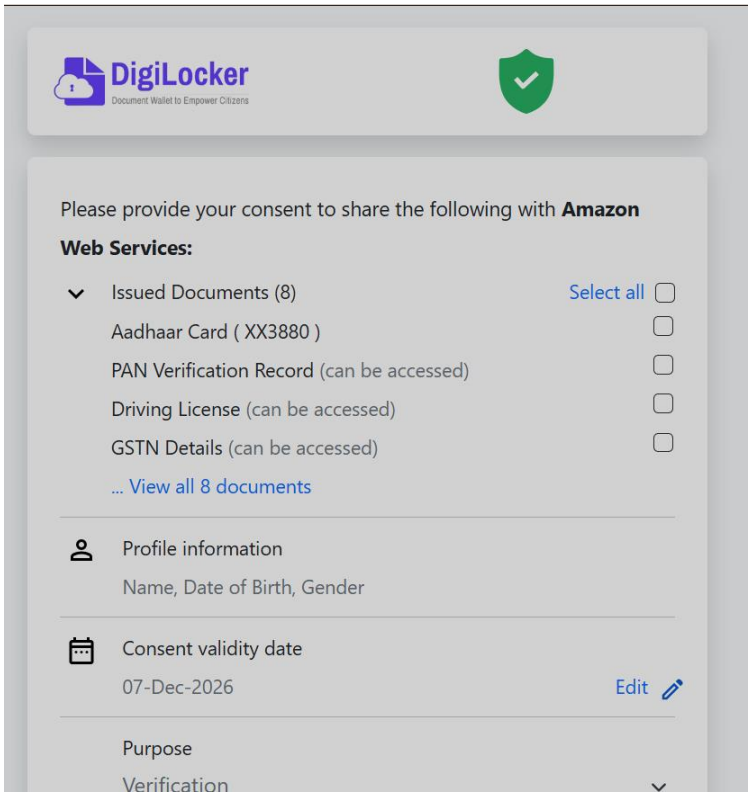

5. Set a secure password for the AWS account and re-enter it to confirm.

6. Fill in the necessary contact information, including the mobile number and residential address.

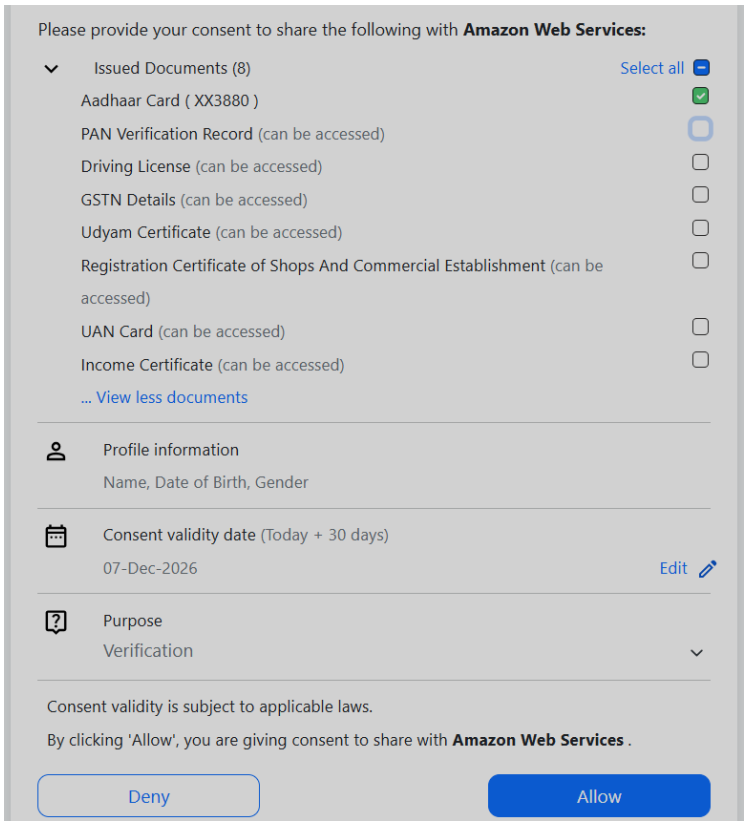

7. Enter the required payment details to proceed with the account registration.

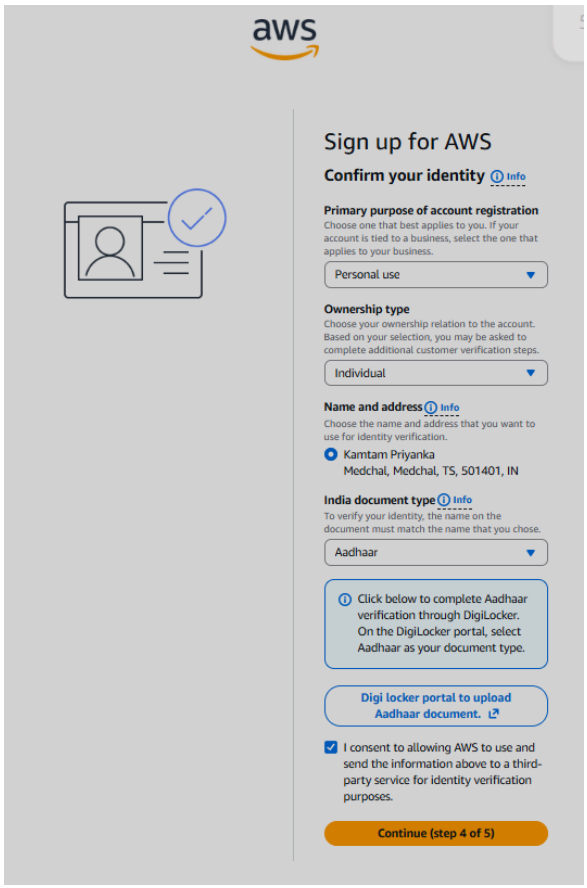

8. Complete the identity verification process through DigiLocker.

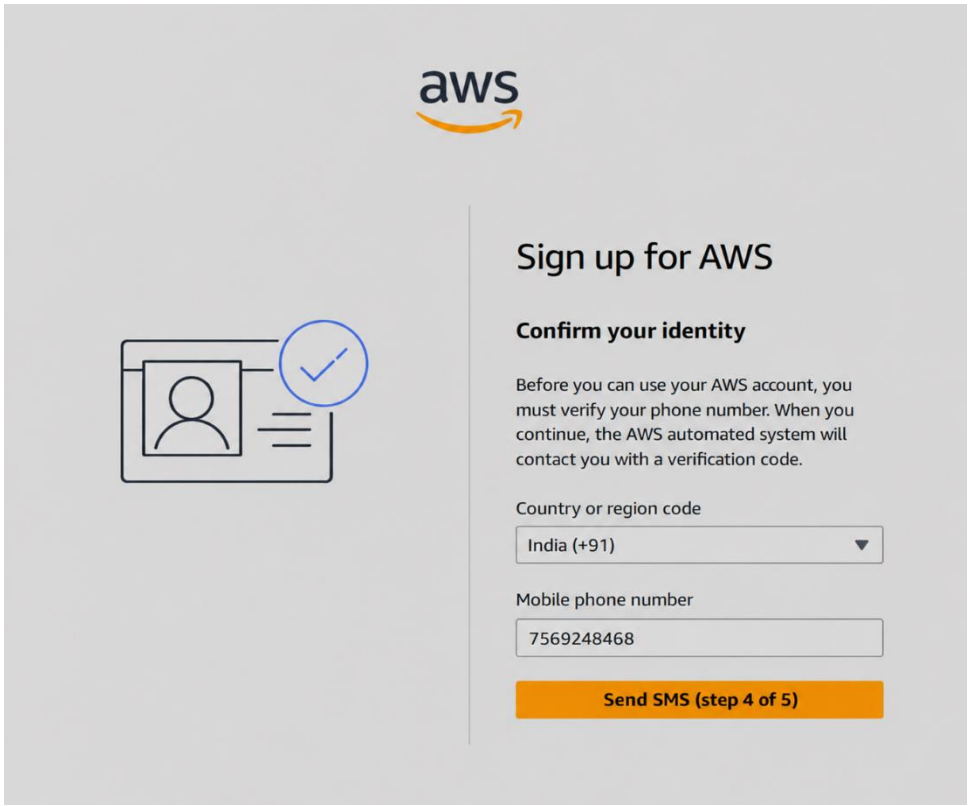

9. Select DigiLocker as the preferred verification method and follow the instructions displayed on the screen.

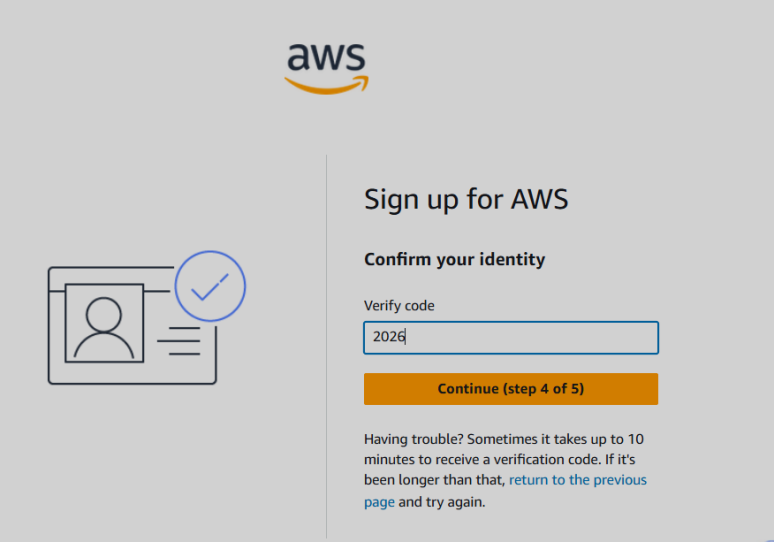

10. Proceed with the identity confirmation process by providing the requested details.

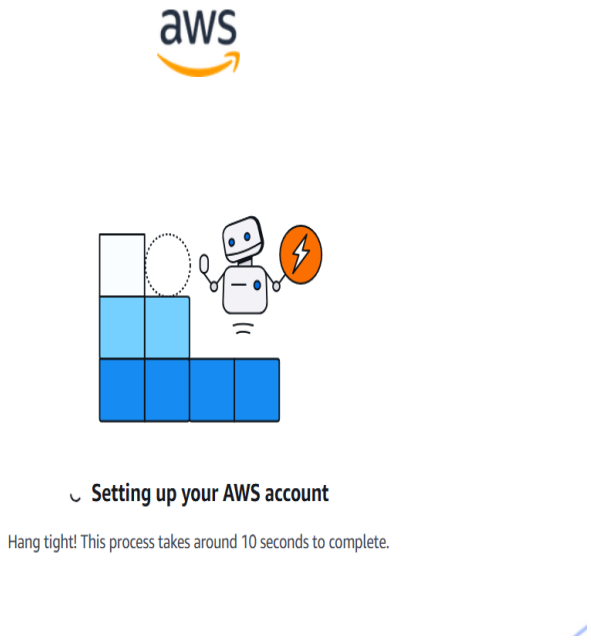

11. After successful identity verification, continue with the contact number verification.

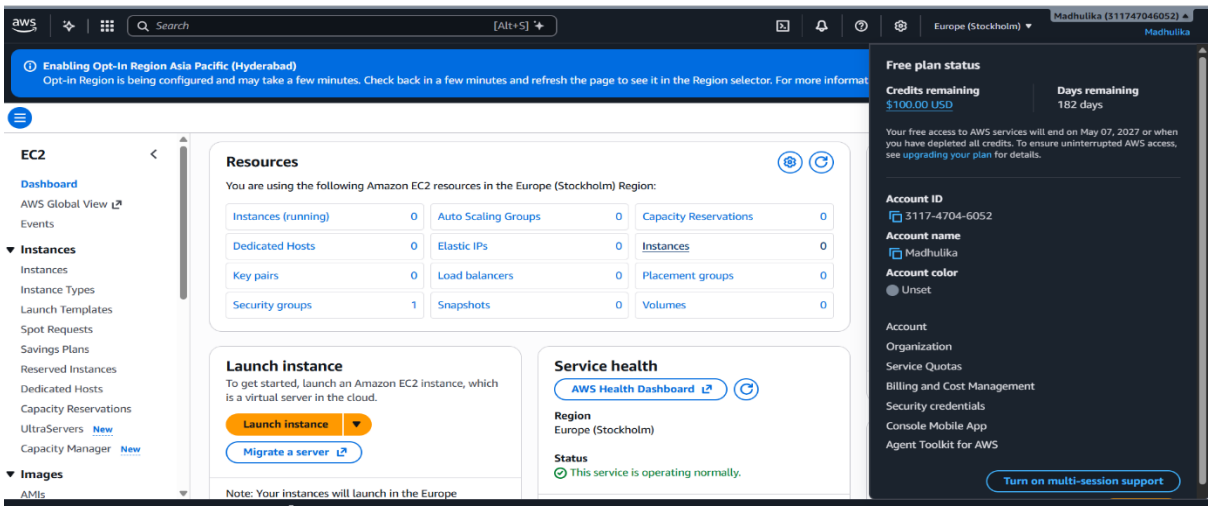

12. Enter the OTP received on the registered mobile number to verify the contact information.

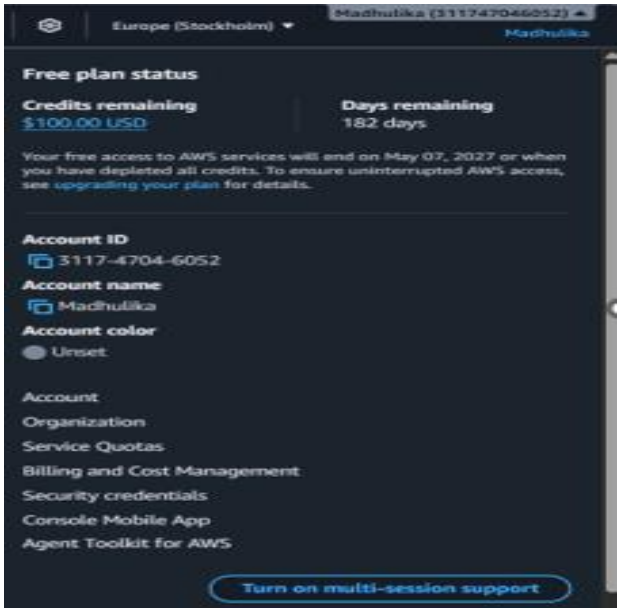

13. Wait while AWS processes the submitted information and completes the account creation Process.

14. Once the registration is successful, access the AWS Management Console. The dashboard confirms that the AWS account has been created successfully.

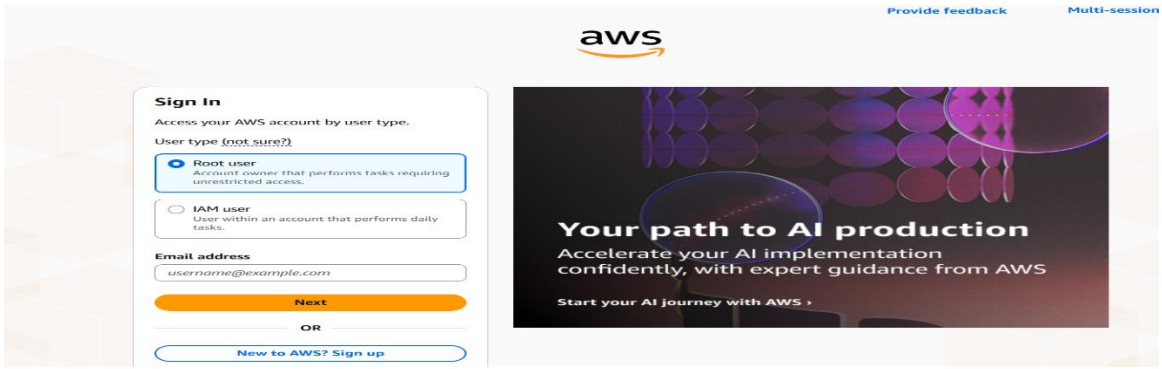

15. Open the account information section to view the details associated with the newly created AWS account.

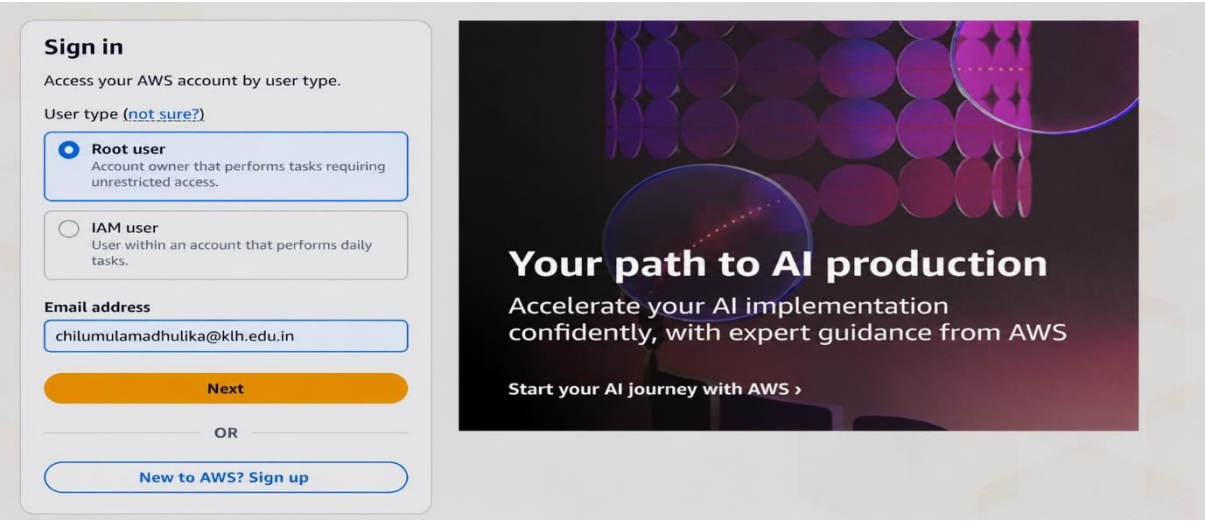

2. Configuring Multi-Factor Authentication (MFA)

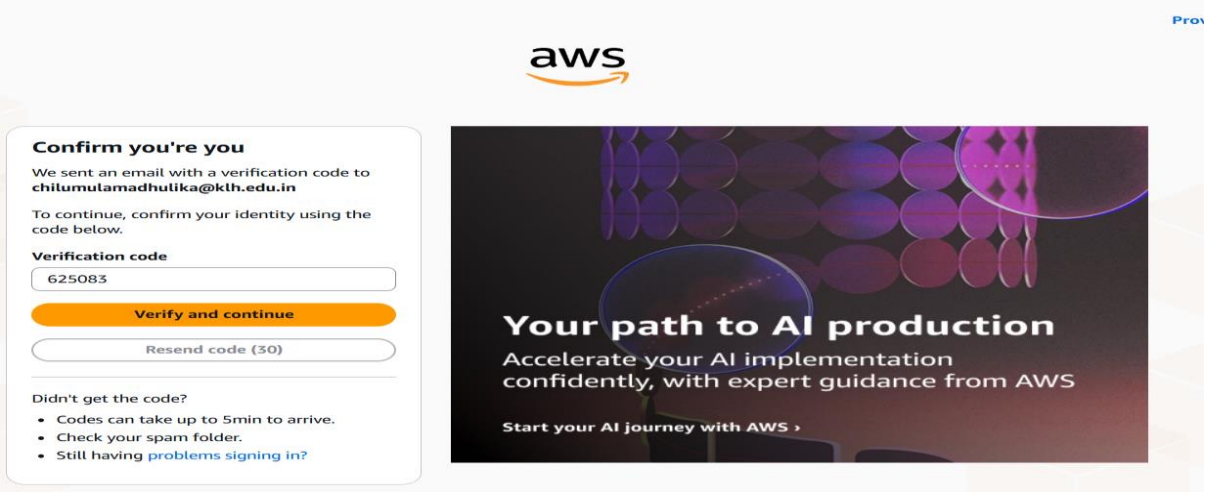

Step-wise procedure:

1. Sign in to the AWS Management Console using the registered account credentials.

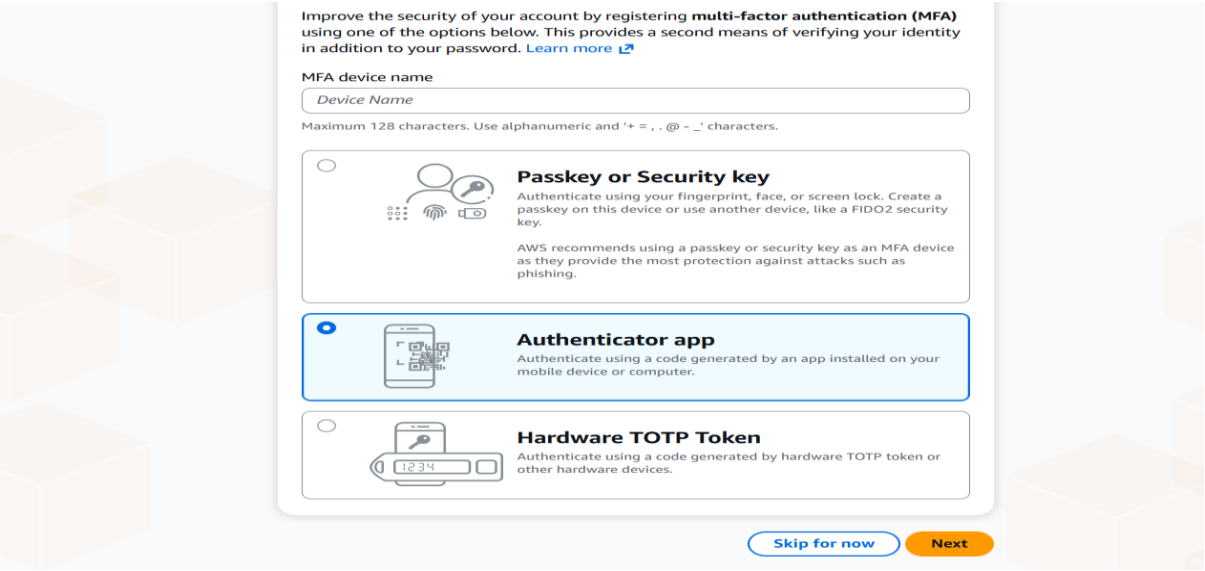

2. Open the account menu and navigate to the **Security Credentials** section to access the account security settings.

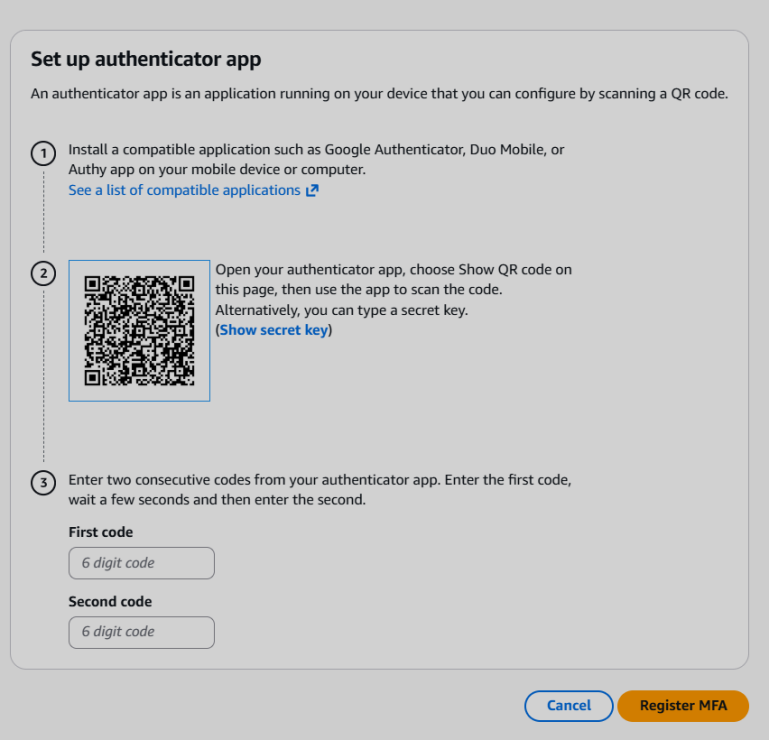

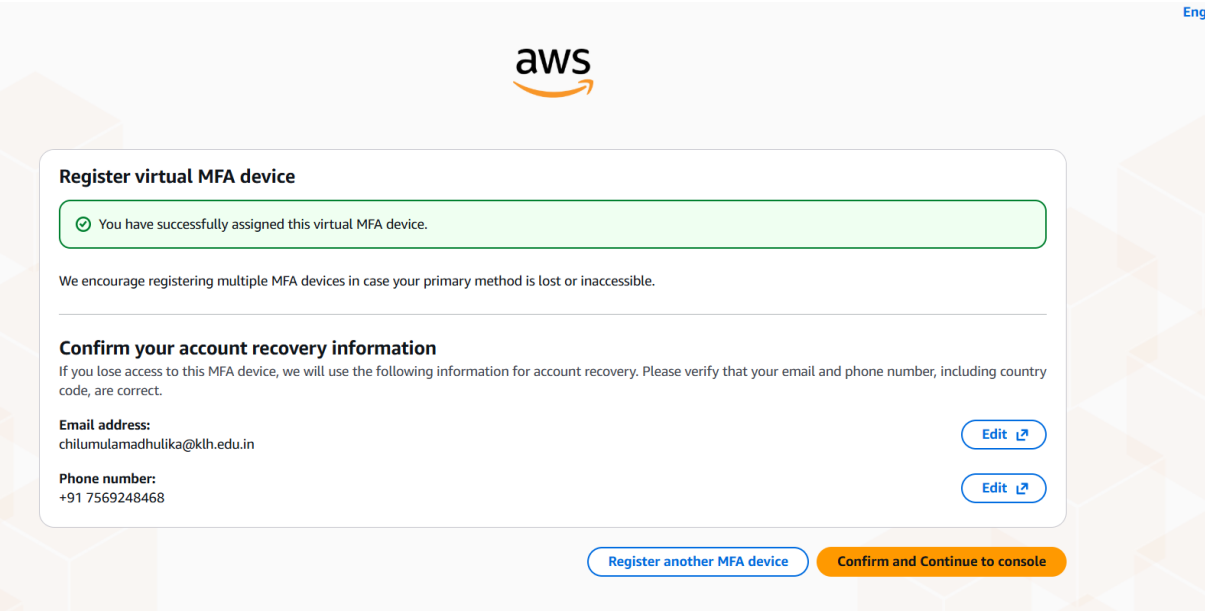

3. Locate the **Multi-Factor Authentication (MFA)** option and select **Assign MFA Device** to begin the configuration.

4. A QR code will appear on the screen. Open an authenticator application on your mobile device and scan the displayed QR code.

5. After scanning, the application will generate authentication codes that can be used for account verification.

6. Finally, access the AWS Management Console dashboard to confirm that the account is secured with MFA.
