Practical Week-2

Ch.Madhulika-2520090056

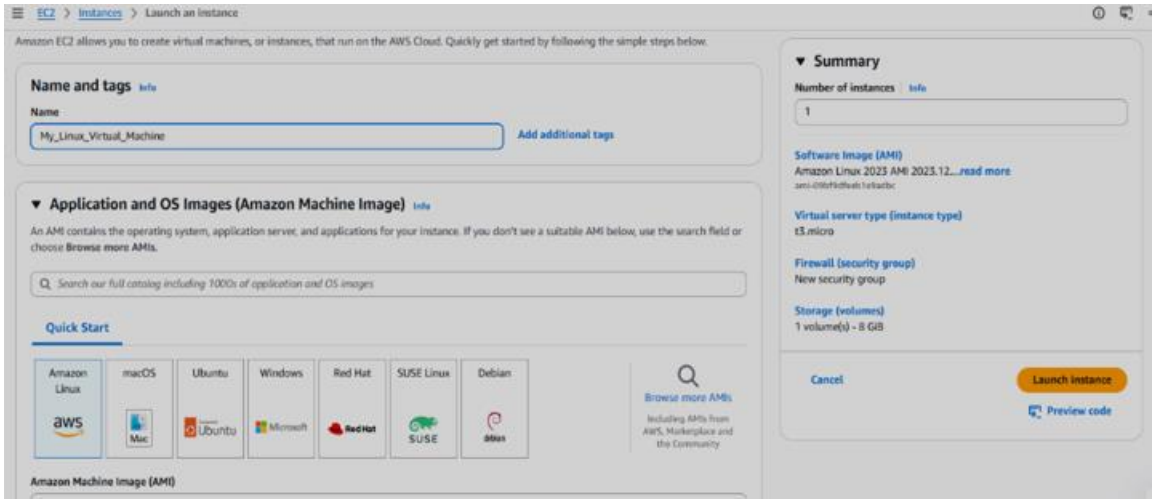

Sec-11

Task-1: Linux Virtual Machine Creation

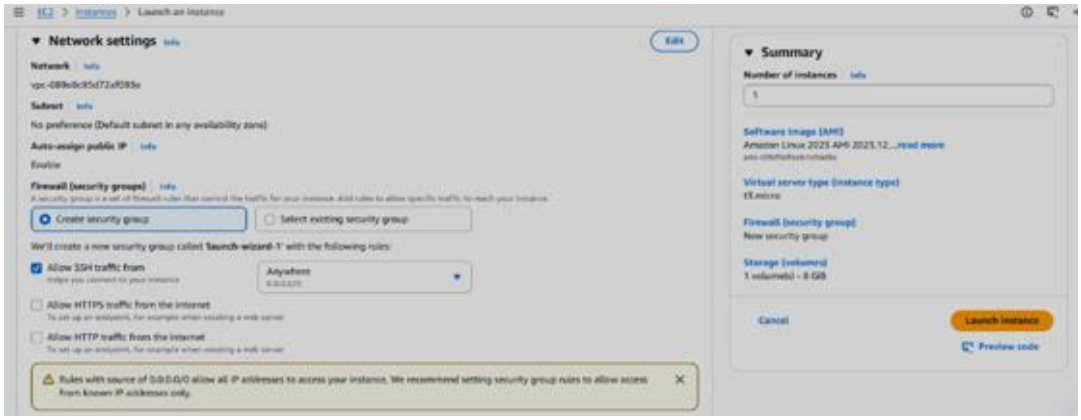

Step-by-Step Procedure:

1. Open the AWS Management Console and navigate to the EC2 Dashboard. Click on the Launch Instance option.

2. Enter the instance name as My_Linux_Virtual_Machine and select Amazon Linux as the application and operating system.

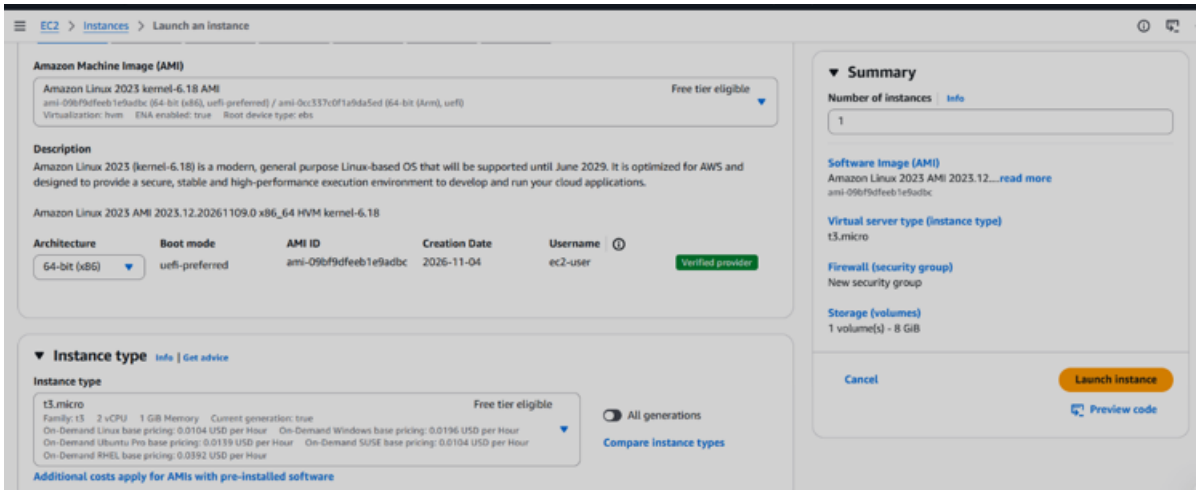

3. Navigate to the Network Settings section and enable Allow SSH traffic from anywhere.

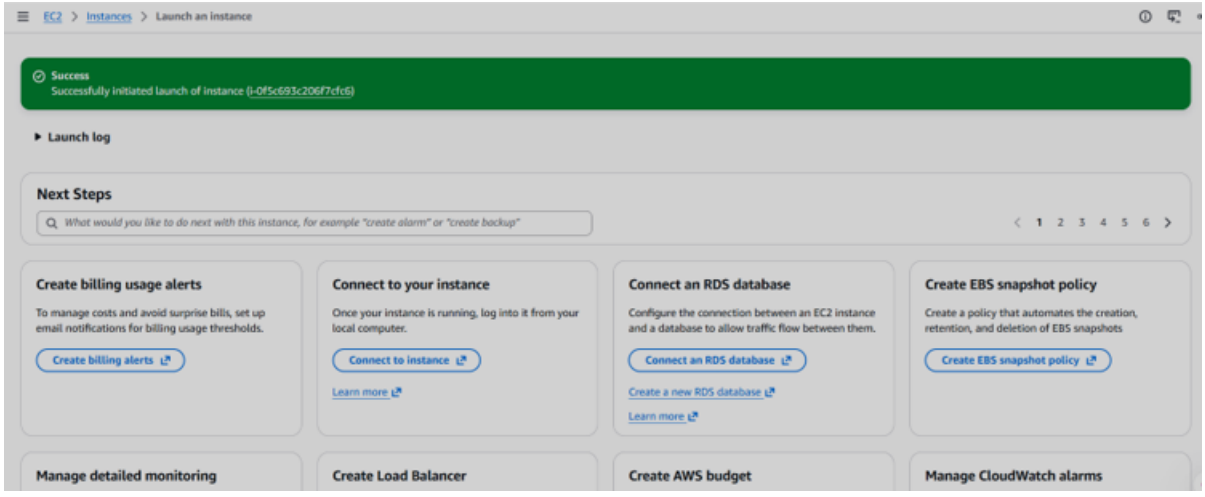

4. Create a new key pair and provide the key pair name as Key_1. Keep the remaining default settings unchanged.

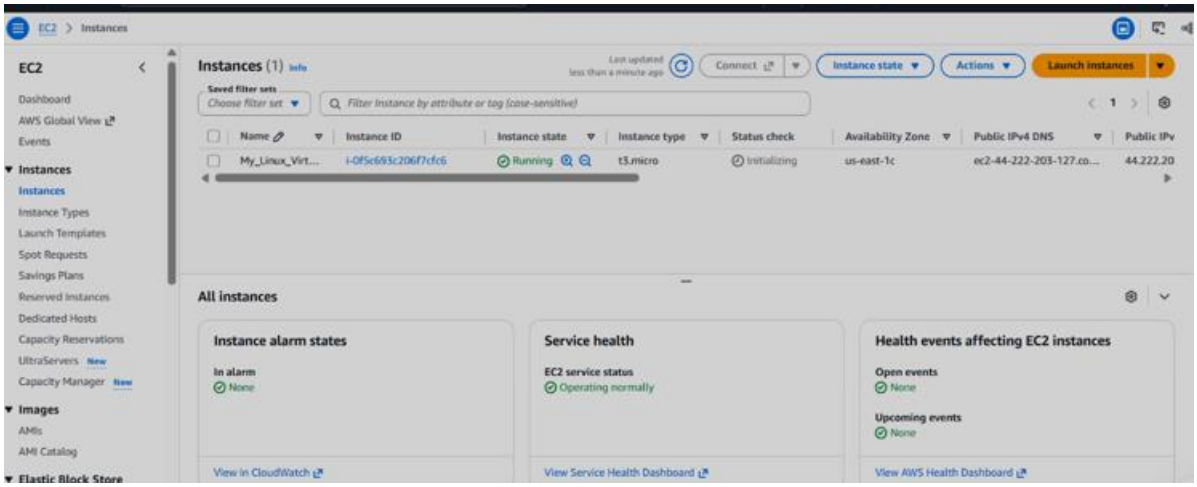

5. Keep all the other configuration settings at their default values and click on Launch Instance.

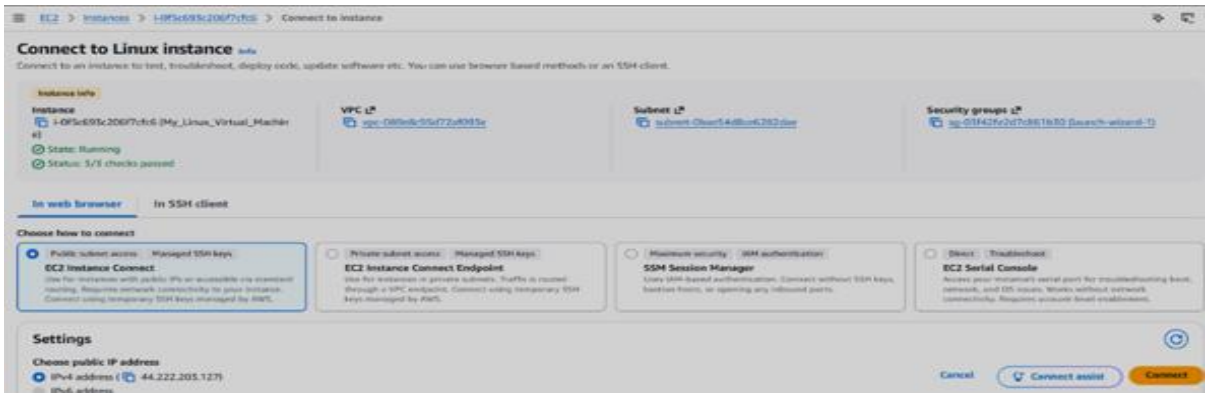

6. Wait until the instance is successfully launched and its status becomes running.

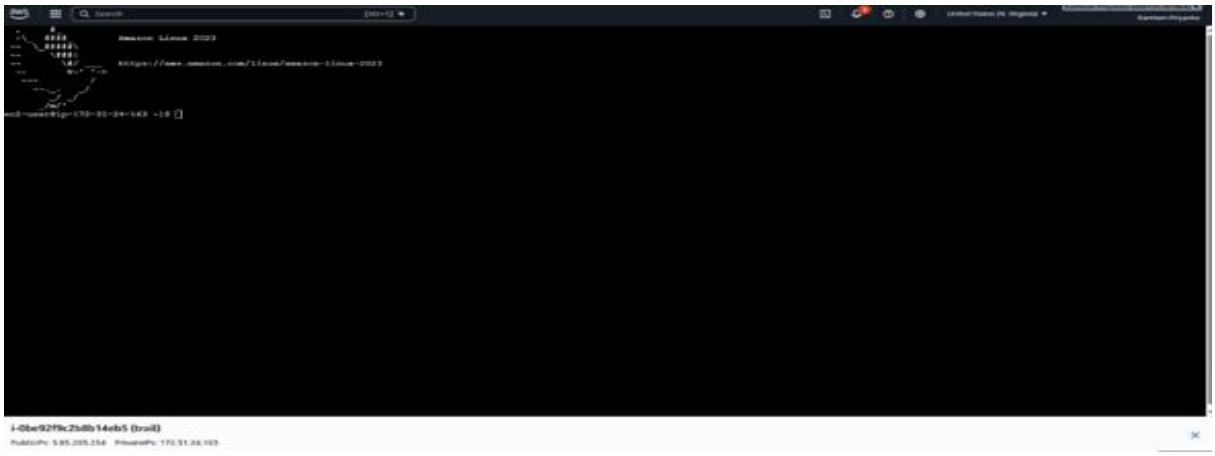

7. Return to the EC2 Instances page, select the created instance, and click on the Connect option.

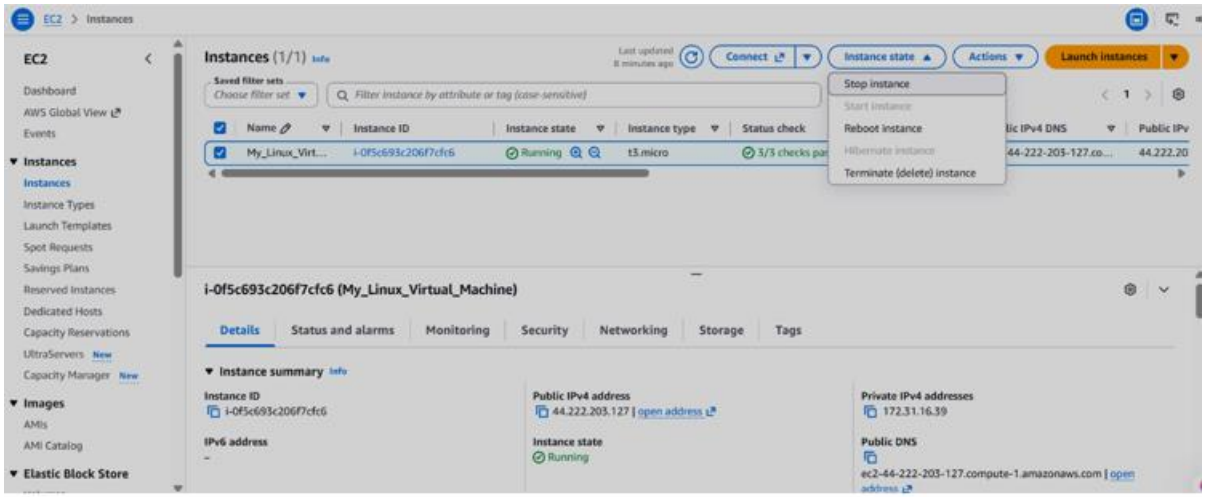

8. Select EC2 Instance Connect and choose the appropriate connection option using IPv4.

9. Click on Connect to establish the connection. The Linux virtual machine will open successfully.

10. After completing the task, stop or terminate the instance to avoid unnecessary resource usage.

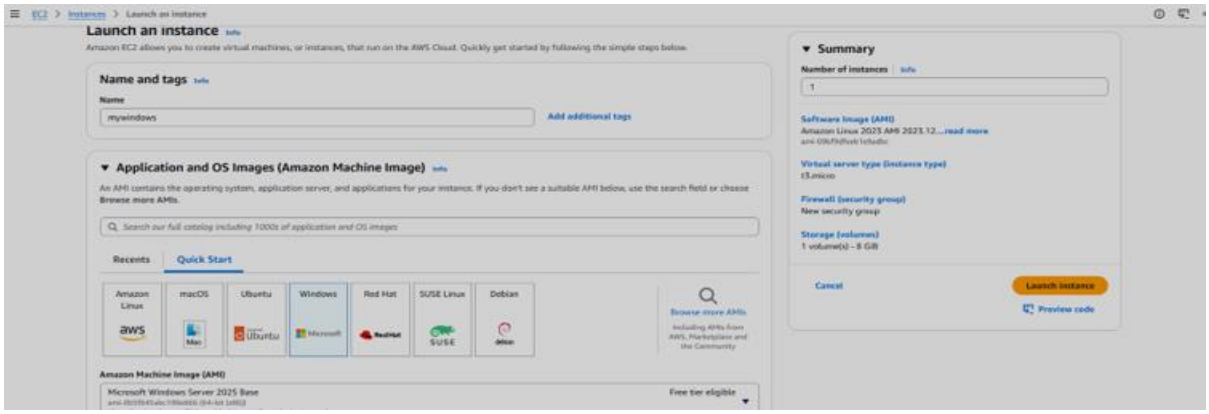

Task-2 Windows Virtual Machine Creation

Step-by-Step Procedure:

1. Open the AWS Management Console and navigate to the EC2 Dashboard. Click on the Launch Instance option.

2. Enter the instance name as mywindows and select Windows as the application and operating system.

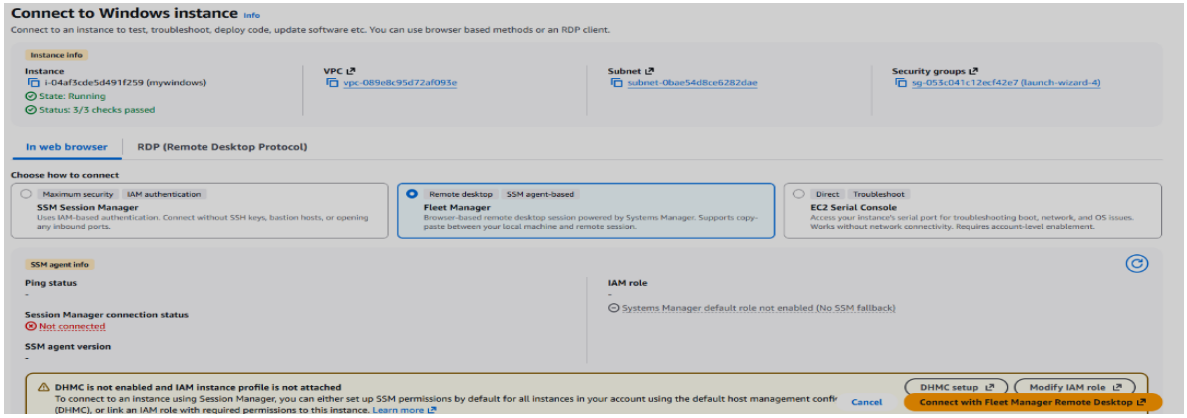

3. Navigate to the Network Settings section, select HTTP as required, and leave the remaining configuration settings at their default values.

4. After configuring the instance, click on Launch Instance and wait until the instance is successfully created.

5. Select the newly created Windows instance and click on the Connect option. Choose Fleet Manager under the browser-based connection options.

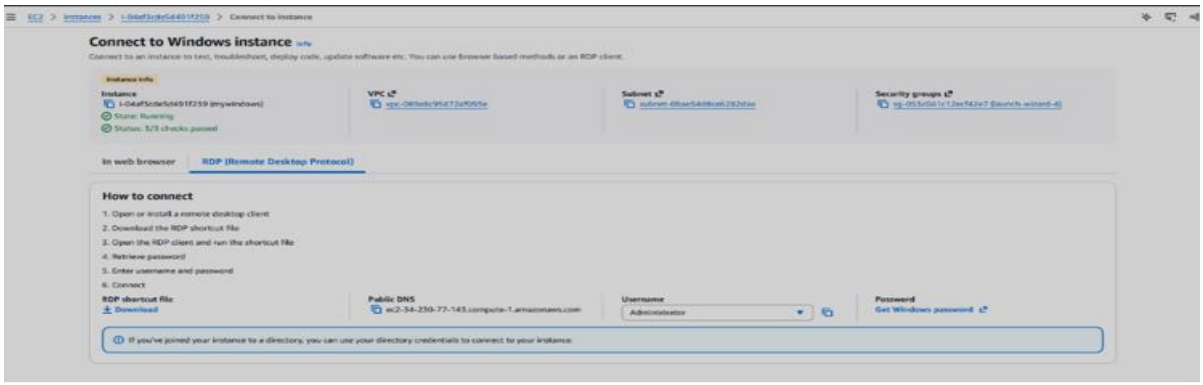

6. Click on Get Windows Password to navigate to the password retrieval page.

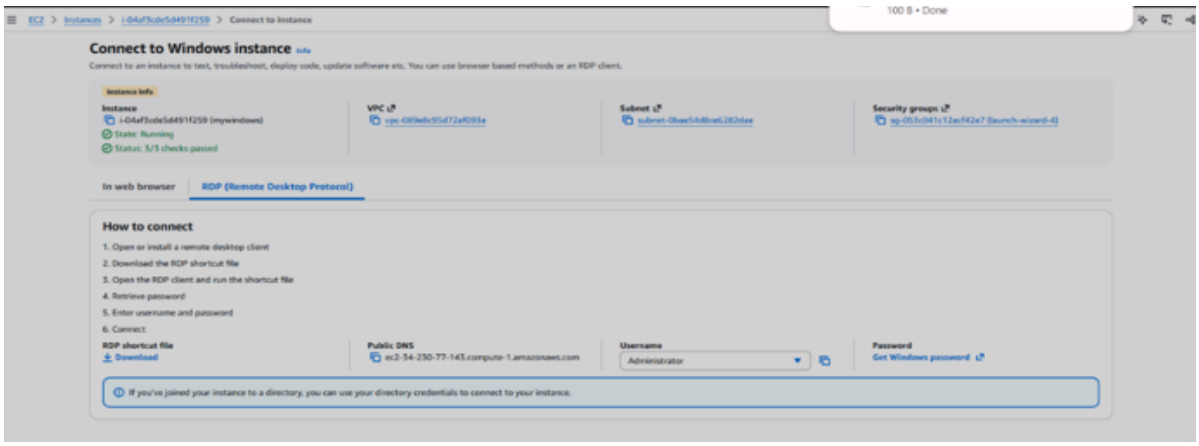

7. Upload the key pair file created for the instance and select Decrypt Password. Copy the decrypted password for future use.

8. Return to the EC2 Instances page, select the Windows instance, click on Connect, and choose the RDP option.

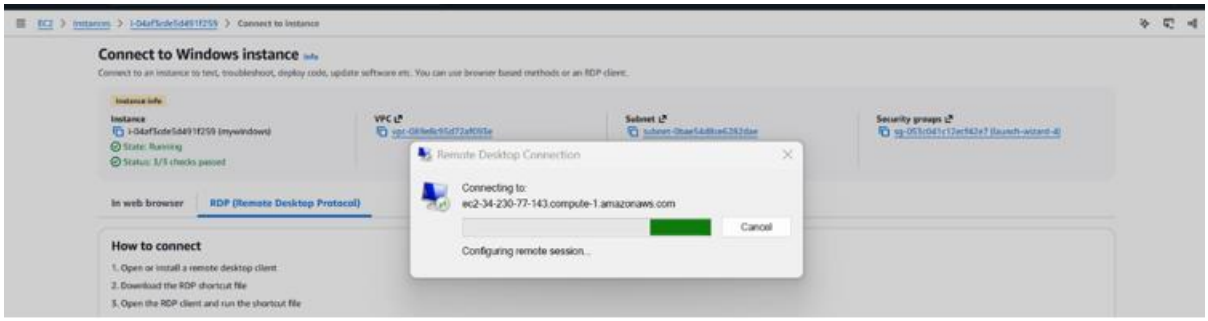

9. Download the RDP shortcut file and open it. Select WebAuthn when prompted and establish the connection.

10. Enter the previously copied Windows password when prompted. After successful authentication, the Windows virtual machine will open in a new window, displaying the remote server environment.

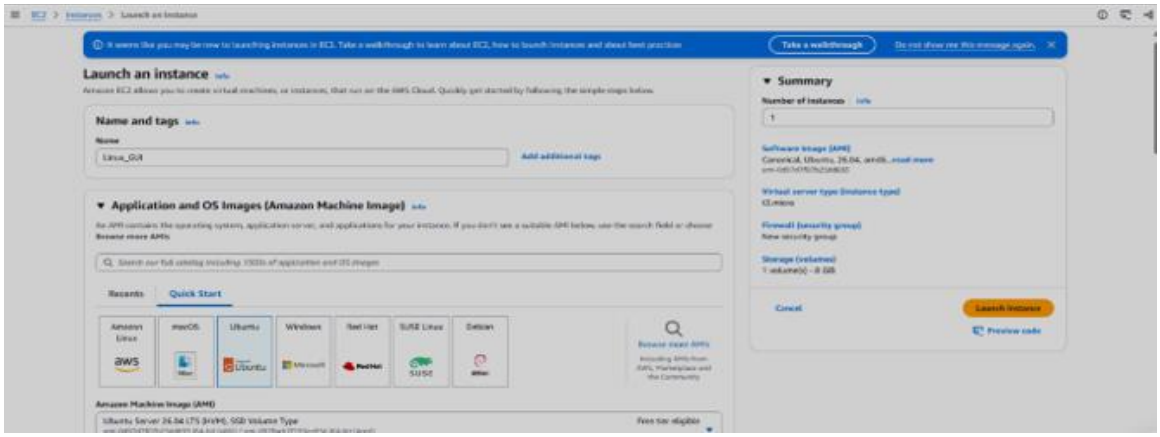

Task-3: Linux GUI Creation

Step-wise Procedure:

1. Open the AWS Management Console and navigate to the EC2 service. Select Launch Instance to create a new virtual machine.

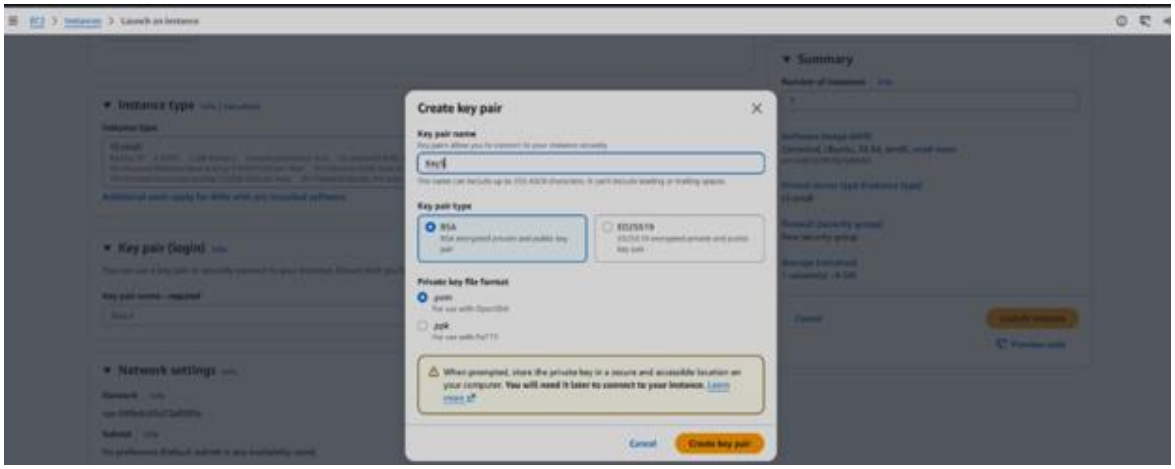

2. Enter Linux_GUI as the instance name and select Ubuntu as the operating system image.

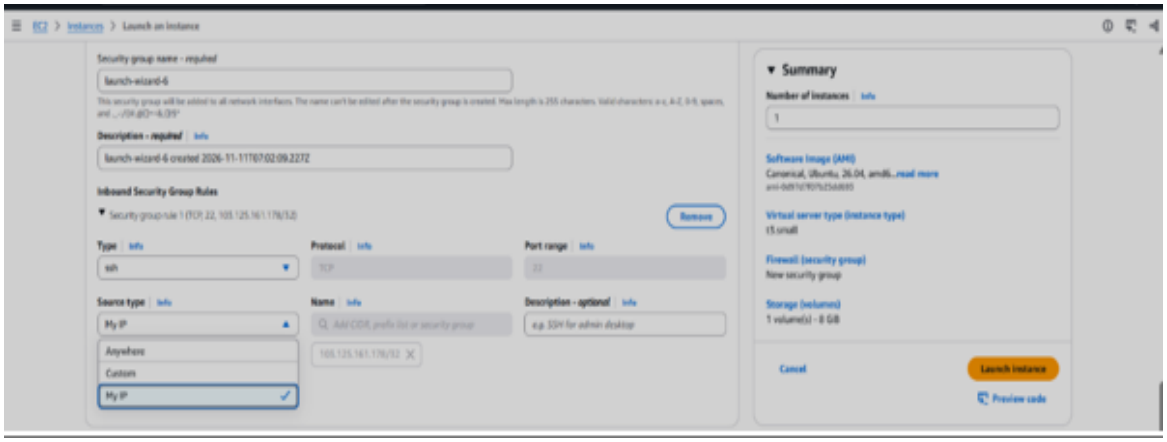

3. Choose **t3.small** as the instance type according to the practical requirements.

4. Create a new key pair to establish a secure connection with the instance. In this practical, the key pair is named Key5.

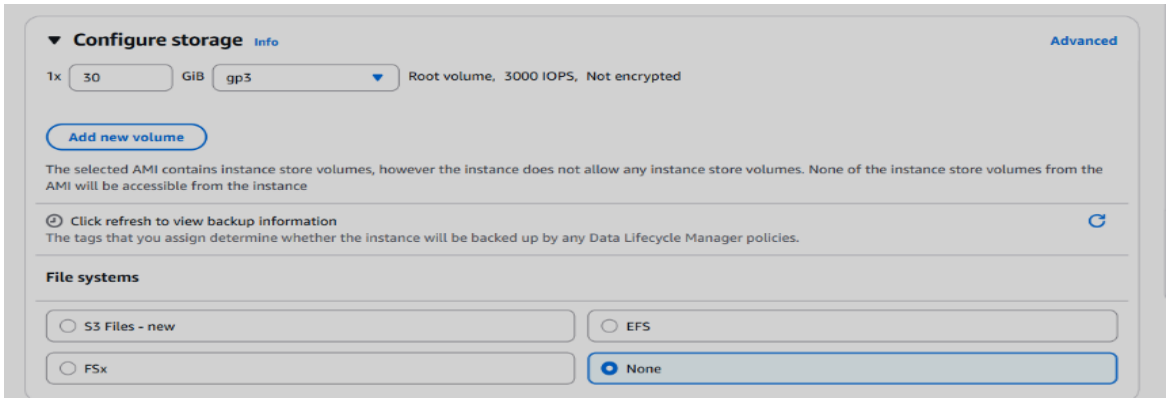

5. Under the inbound security group rules, set the source type to My IP to allow access from the current system.

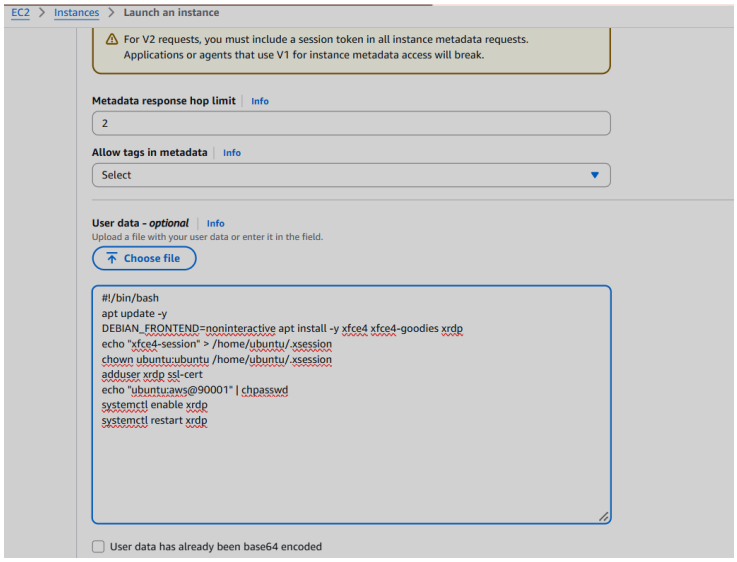

6. Add another security group rule by selecting RDP as the rule type and choosing My IP as its source.

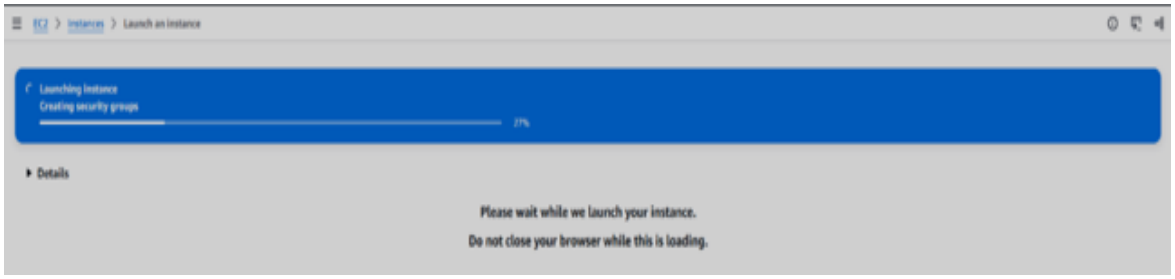

7. Configure the storage capacity and set the volume size to 30 GiB.

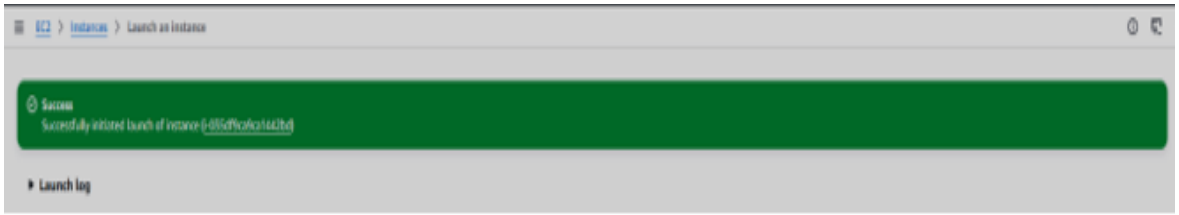

8. Scroll down to the Advanced Details section and enter the required Linux GUI installation commands in the User Data field.

9. After completing all the configurations, click **Launch Instance** to start creating the virtual machine.

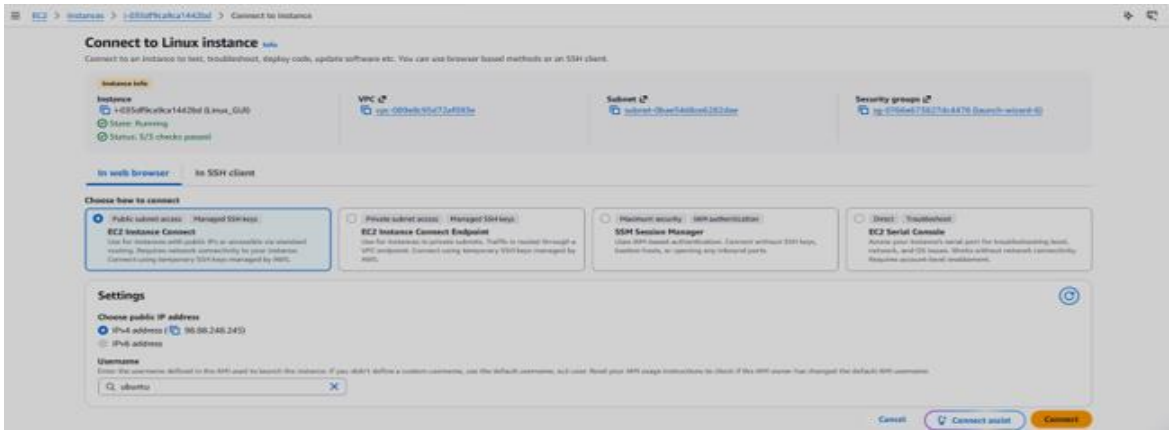

10. Wait until AWS displays the successful instance launch confirmation.

11. Navigate to the Instances section, select the newly created Linux GUI instance and click Connect.

12. In the connection options, select **EC2 Instance Connect** under the EC2 Connect tab, choose the web browser connection method and select the IPv4 address.

Task-4 Storage Creation Using Amazon S3

Step-wise Procedure:

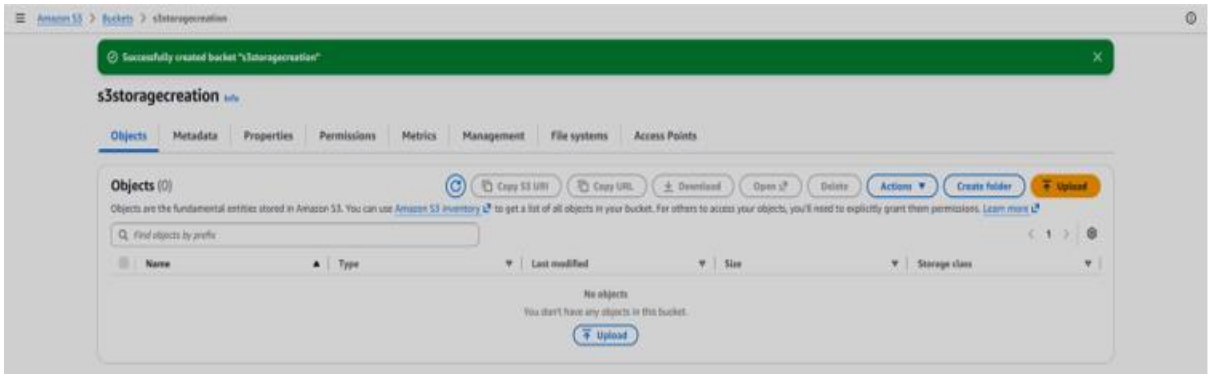

1. Sign in to the AWS Management Console and search for S3 (Simple Storage Service). Open the S3 service and select the option to create a new bucket.

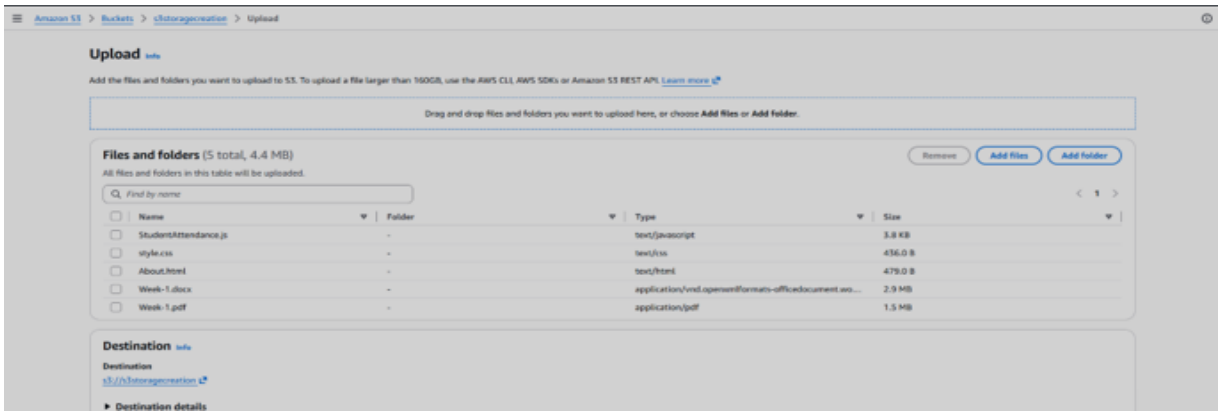

2. Keep the default configuration settings unchanged and provide a unique name for the bucket. In this practical, the bucket name used is s3storagecreation.

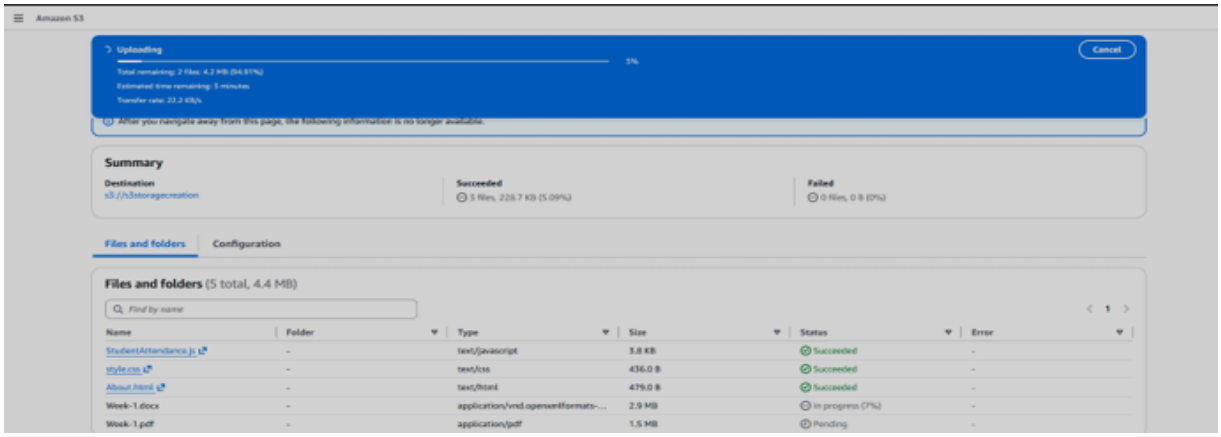

3. Click **Create Bucket** to complete the bucket creation process.

4. After the bucket is created successfully, open it and select the Upload option to add files and folders.

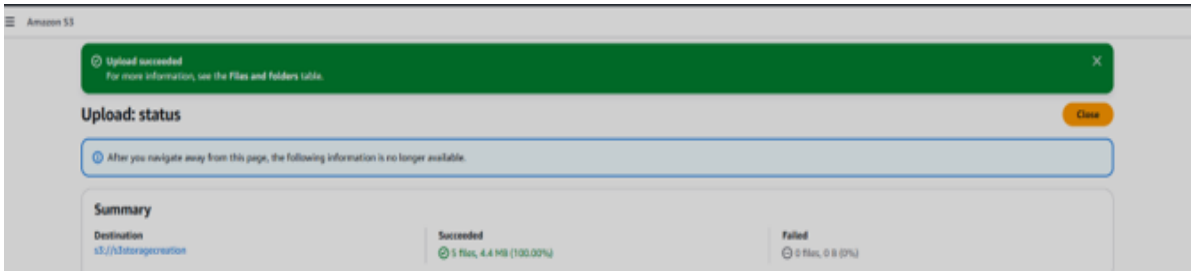

5. Choose the required files and folders from the local system and add them to the upload section.

6. Start the upload process and wait until all the selected files and folders are transferred to the S3 bucket.

7. Once the upload is completed, verify the successful upload status and check whether the uploaded files are visible inside the bucket.

8. In this way, Amazon S3 can be used to create cloud storage and store different types of files and folders securely.
